SUPRATHEL as a new graft donor site dressing

Introduction

There are a variety of products on the market that can be used for donor site dressing. SUPRATHEL is an artificial skin substitute that has a thin elastic membrane that adapts itself optimally to the surface of a wound. It is only applied once onto a previously cleaned area and can remain there until the wound has healed. Applications mainly include; donor site dressing and use in deep partial thickness wounds. There are several benefits of SUPRATHEL, including reduced pain, dressing changes and lowered costs.

Discussion

SUPRATHEL as a donor site dressing has many added benefits. Cases thus far where we have used SUPRATHEL as a donor site dressing have had positive results and high patient satisfaction with low infection rates.

Conclusions

SUPRATHEL is an effective option for a donor site dressing with several significant benefits. It is simple, easy to use, doesn't require changing and reduces costs. The patients find it comfortable and easy to remove.

Results

Our preliminary findings of donor site healing with SUPRATHEL are positive. We've noticed we are able to leave the dressing on for the full two weeks until the wound has healed. It's time effective and reduces the need for extra wound clinics. We noticed reduced pain with removal, easy monitoring through a clear field and comparative healing to other dressings.
